

## Room Control System Make your guests a home

Sometimes staying at a hotel is just not enough. Do you want to make your guests feel at home? Do you want to exceed their expectations of excellent service and convenience? Do you think about reducing your energy consumption significantly and streamlining your business processes? Our room control solution brings you one step closer to a digitally smart environment. Let us help you. We can support you and provide you with technologies and services – not only to benefit your clients, but yourself as well.

### Room control at a glance

- Efficient power management of electrical equipment minimizes energy consumption
- Automated operations and simplified control functionalities for areas reduces internal process costs
- Pro-active room maintenance
- Service requests by guests increases guest services and convenience

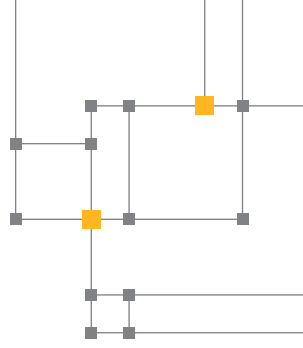

### Personal Home Comfort

Our Room Control System enables your guests to easily control all electrical components inside their guest rooms, such as air conditioning, fan, lighting, TV, door panels, curtains and blinds. Whether guests manage their comfort zone via the Velimo mobile app or via digital wall panels – both user-friendly interfaces allow them to easily create their personal home comfort. Can you imagine how comfortable it is to relax at the pool and to set your climate control at the same time in order to ensure your room is cool once you get back?

The core component of our Room Control System is its configurable backend controller, which centralizes management and monitoring for all integrated electrical components. IP accessible, this offers several benefits to you as well.

### Energy management and device monitoring

Our Room Control System facilitates the optimization of energy management and device monitoring for your hotel or cruise ship. Depending on pre-defined business processes each electrical component can be set into an individual energy-saving mode – automatically and centralized. Can you imagine how eco-friendly and cost-saving it is to reduce heating or cooling when your guests are out of their rooms?

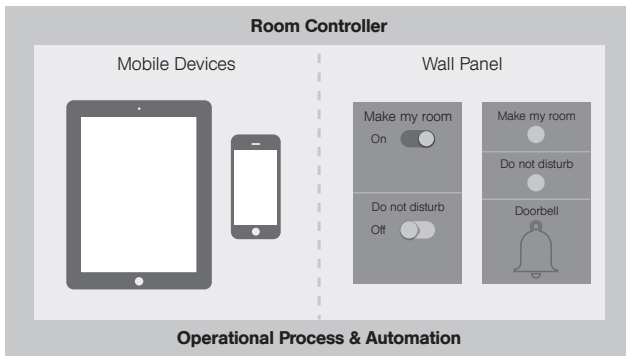

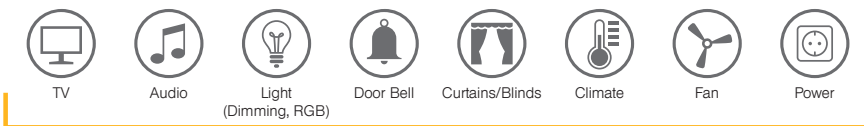

## Recognize failures before they occur

Our Room Control System allows you to easily change defective components before your guests encounter any inconvenience. The back office administration interface is available for your operating staff on different devices, e.g., handhelds, mobile phones, tablets or notebooks, and its task and ticket system makes your maintenance process even more efficient.

## Adjustable to changing requirements

The Room Controller is adjustable to commonly used third-party system interfaces (e.g., Lutron, Incom, Dali) and adaptable to changing requirements or market expectations. Each room control solution is unique and exactly fitting to the customer's specific requirements. Existing business and operational processes will be taken under consideration as well as all technical, marketing and service requirements. Our Room Control System can be implemented for newly built projects as well as for already existing establishments.

Make my room

Do not disturb
